

Designing Sponge Cities for multiple benefits: integrating nature-based solutions to create sustainable places (DeSCIPHER)

Europe lead: Mike Hutchins (UKCEH),
China lead: Shen Yu (CAS Institute of Urban Environment (Xiamen))

May 2019 – April 2022

Norway

China

Objectives

Our ethos ...

Learning
from each
other and
working
together

Key questions:

- How does the size of implemented Nature Based Solutions (NBS) and the spatial extent of its influence affect the arising co-benefits and trade-offs between a range of environmental quality indicators?
- How are these co-benefits and trade-offs affected by climate and social drivers?
- How can business innovation be incentivised to provide or contribute to NBS?

Specific focus on urban forestry and equitable access to urban green space.

Case Studies...

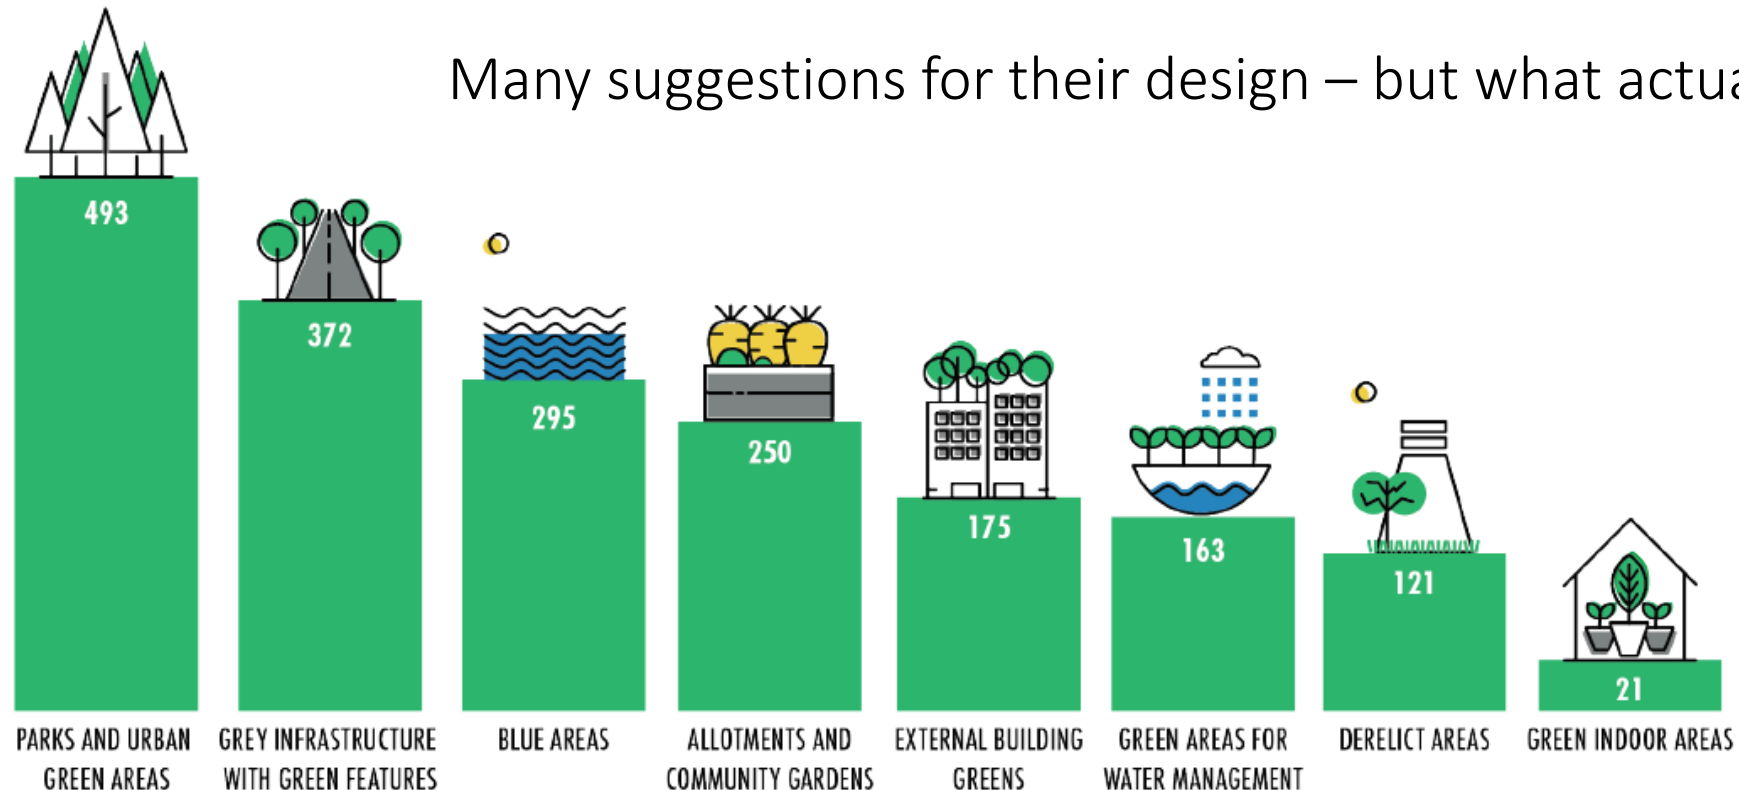

...involve developing and applying models to evaluate NBS
What should our models represent?....

Urban NBS are resource-efficient...

....using natural processes to address many societal challenges.

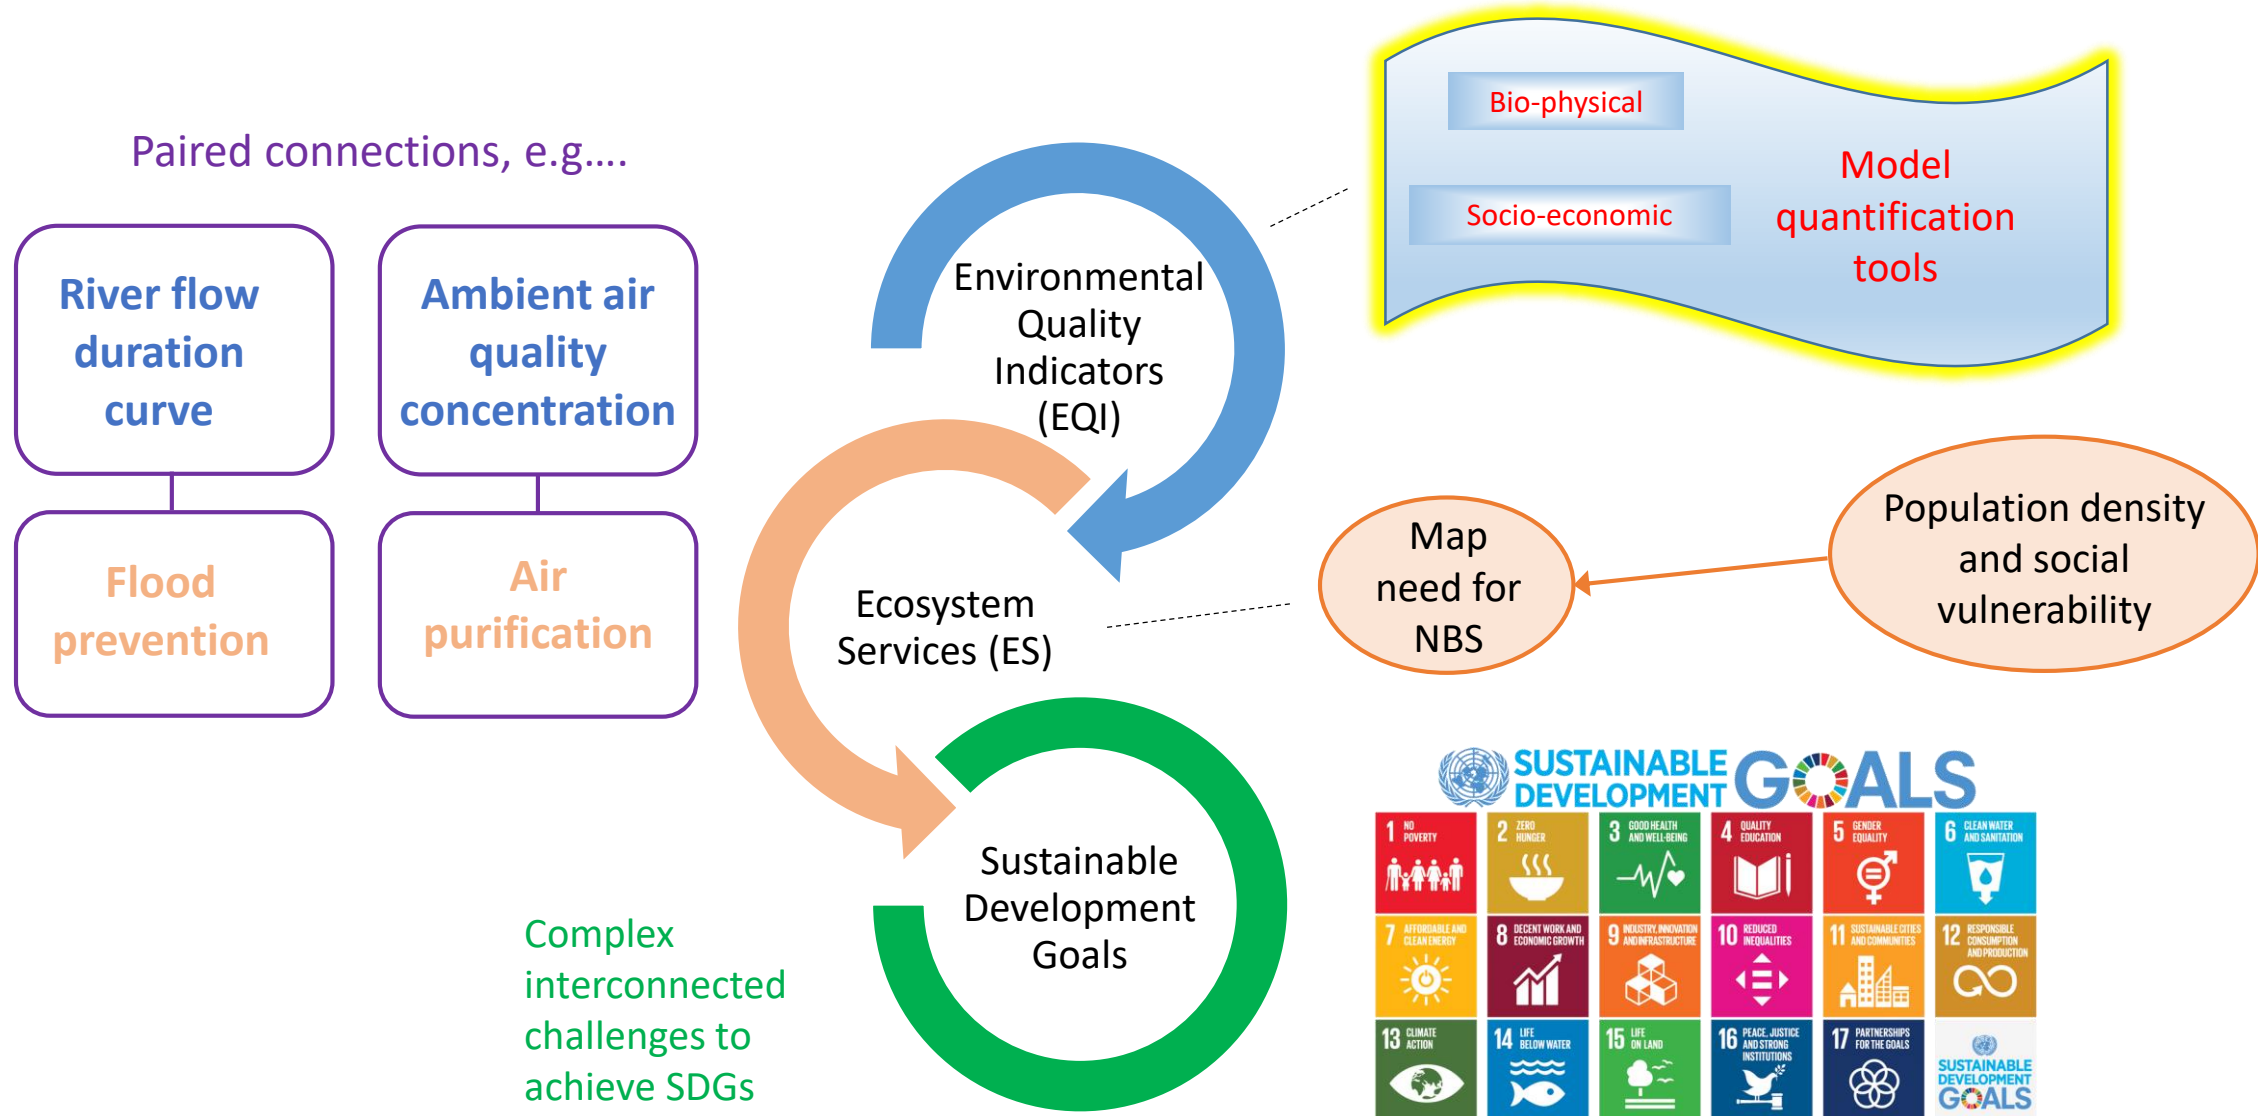

Many suggestions for their design – but what actually happens?

976 NBS projects have been reported. A clear prevalence of urban forestry and parkland.

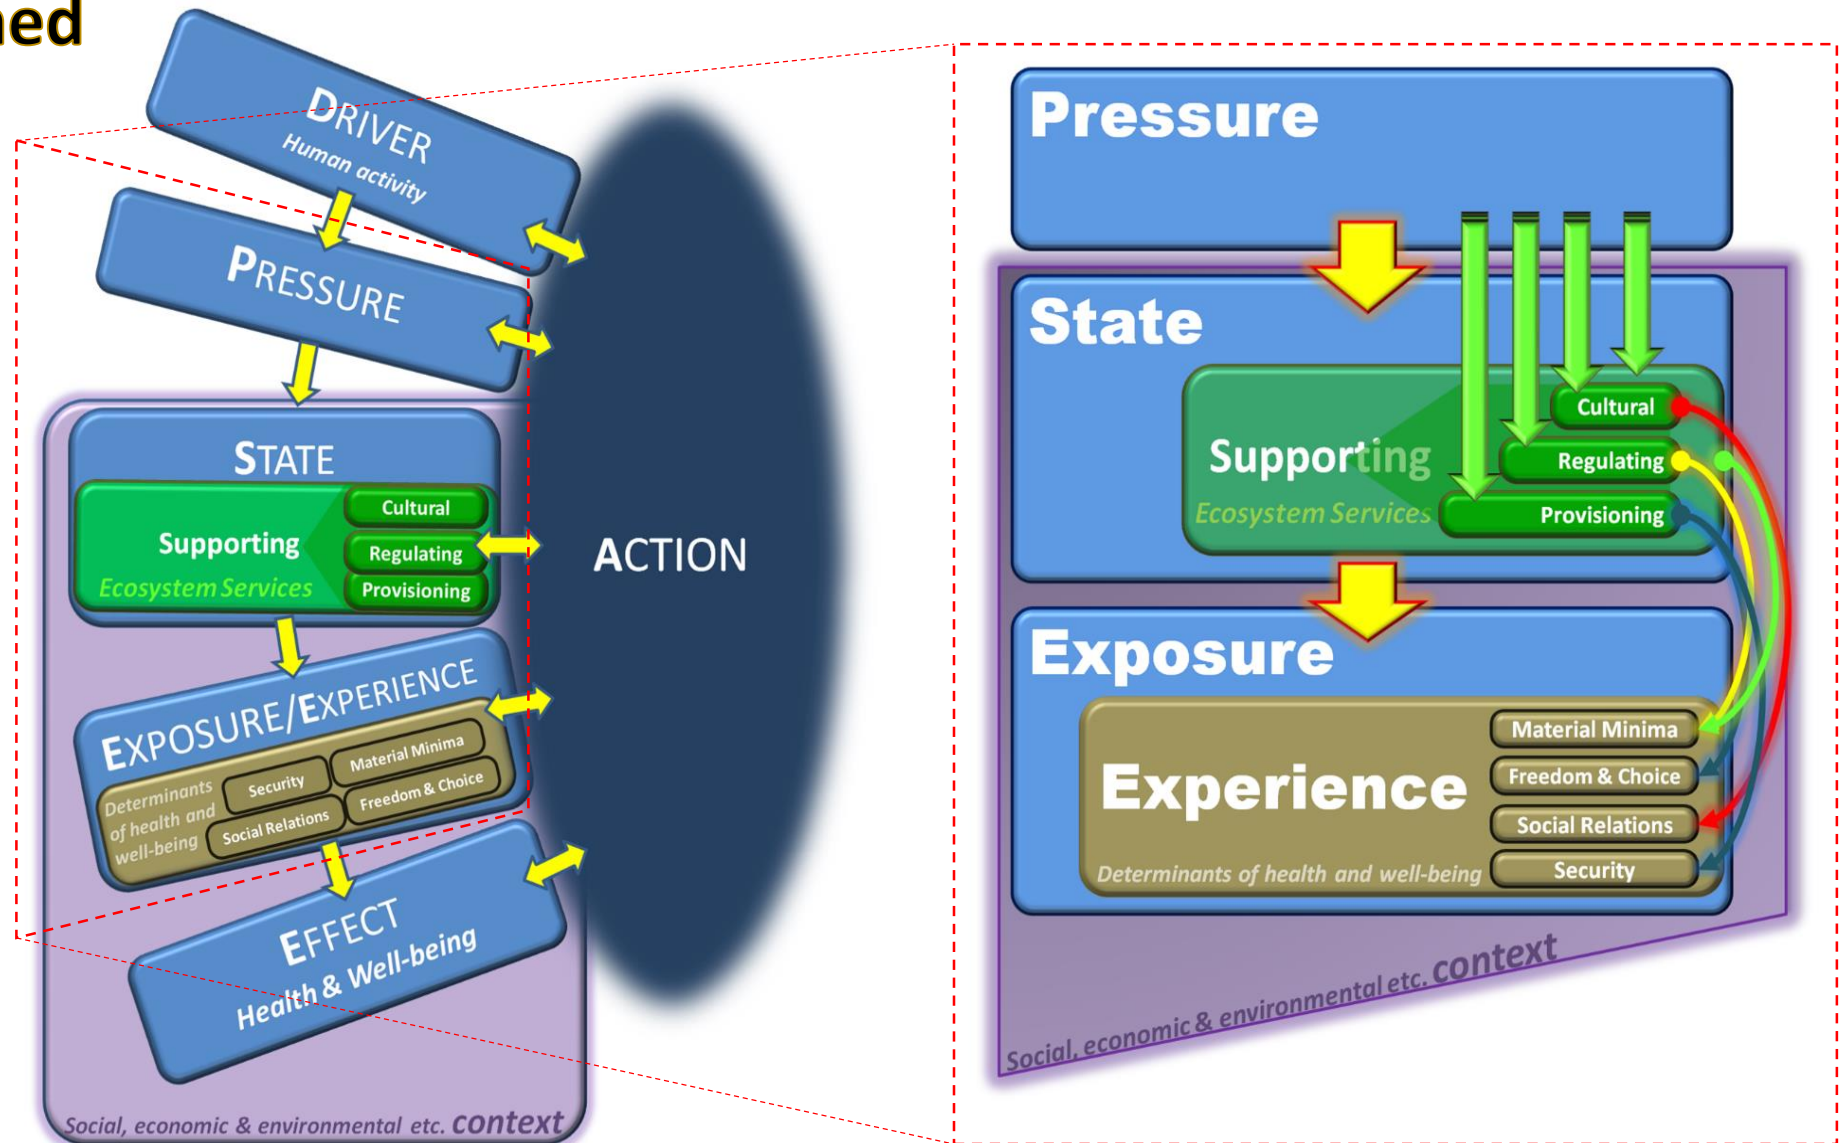

(Almassy et al (2018), Urban Nature Atlas: A Database of Nature-Based Solutions across 100 European cities)

NBS (e.g. urban forestry, parkland) potentially deliver multiple ecosystem service benefits

Ecosystem-enriched DPSEEA

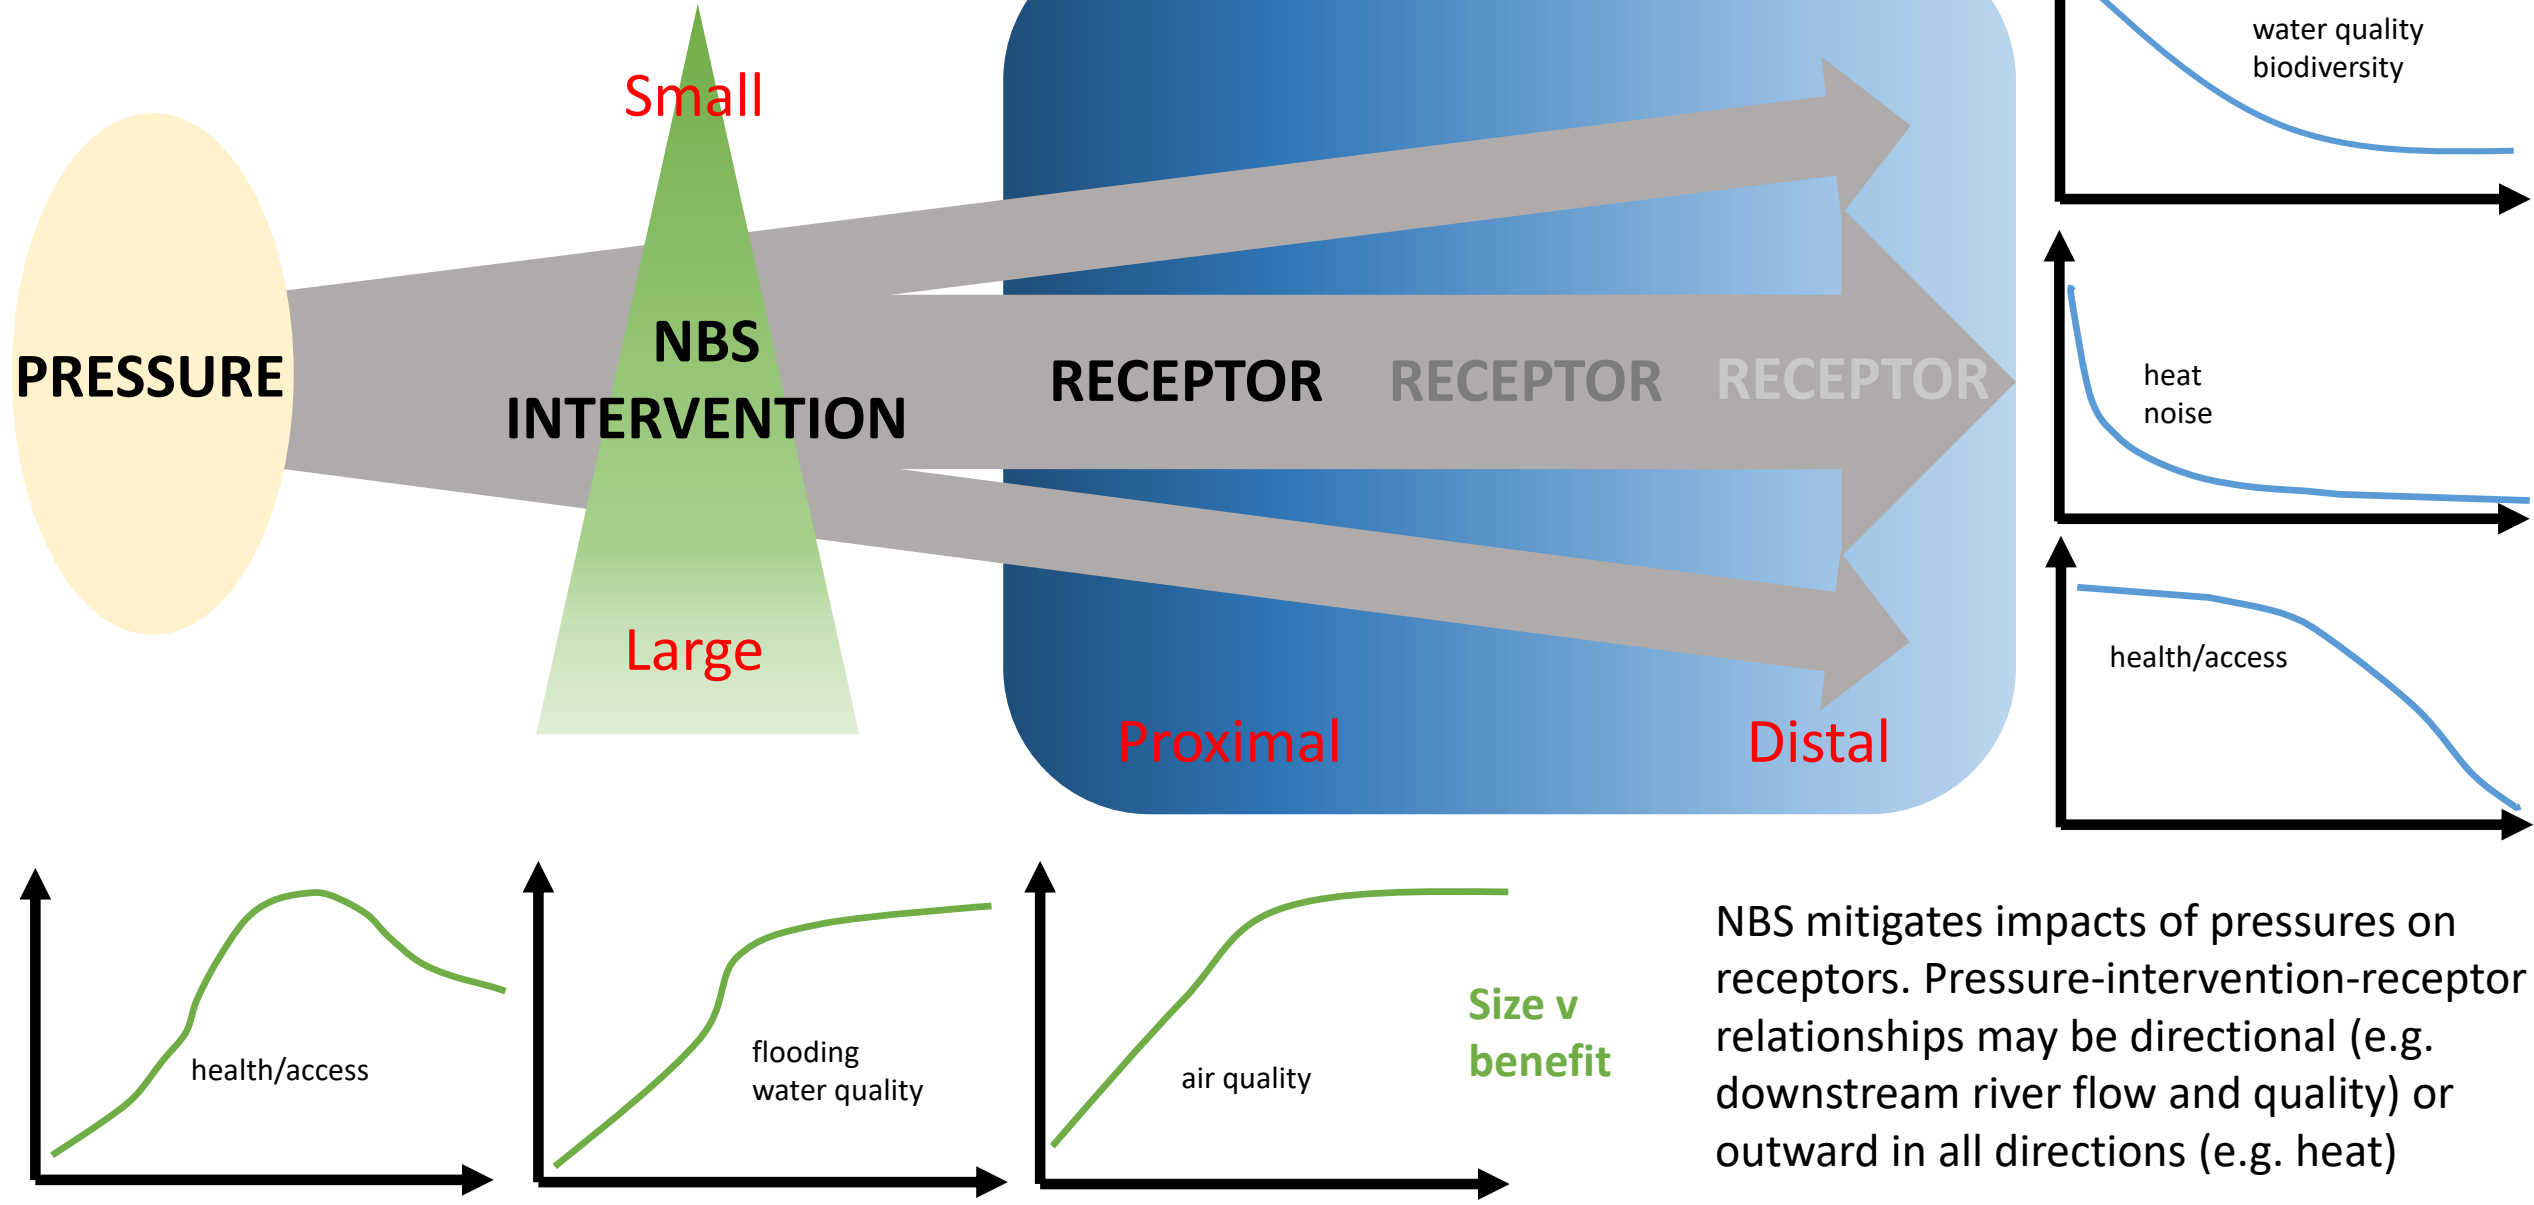

- ‘Ecological Public Health’ highlights that environmental determinants of health can have direct and indirect pathways.
- eDPSEEA is a conceptual model explicitly accounting for this by presenting both direct causal chains, and those modified or moderated by NBS and ES.
- Social, economic and environmental context can further modify the exposure or experience, as well as the effects encountered.

Morris GP, Reis S, et al. (2017) Scoping the Proximal and Distal Dimensions of Climate Change on Health and Wellbeing. Environ Health 16(1): 116, <https://doi.org/10.1186/s12940-017-0329-y>.

Reis S, Morris G, et al. (2015) Integrating Health & Environmental Impact Analysis. Public Health 129(10), 1383–1389. <https://doi.org/10.1016/j.puhe.2013.07.006>.

Scale dependencies (conceptual examples)

Some examples of initial assessments and model applications...

Mapping greenspace in Birmingham

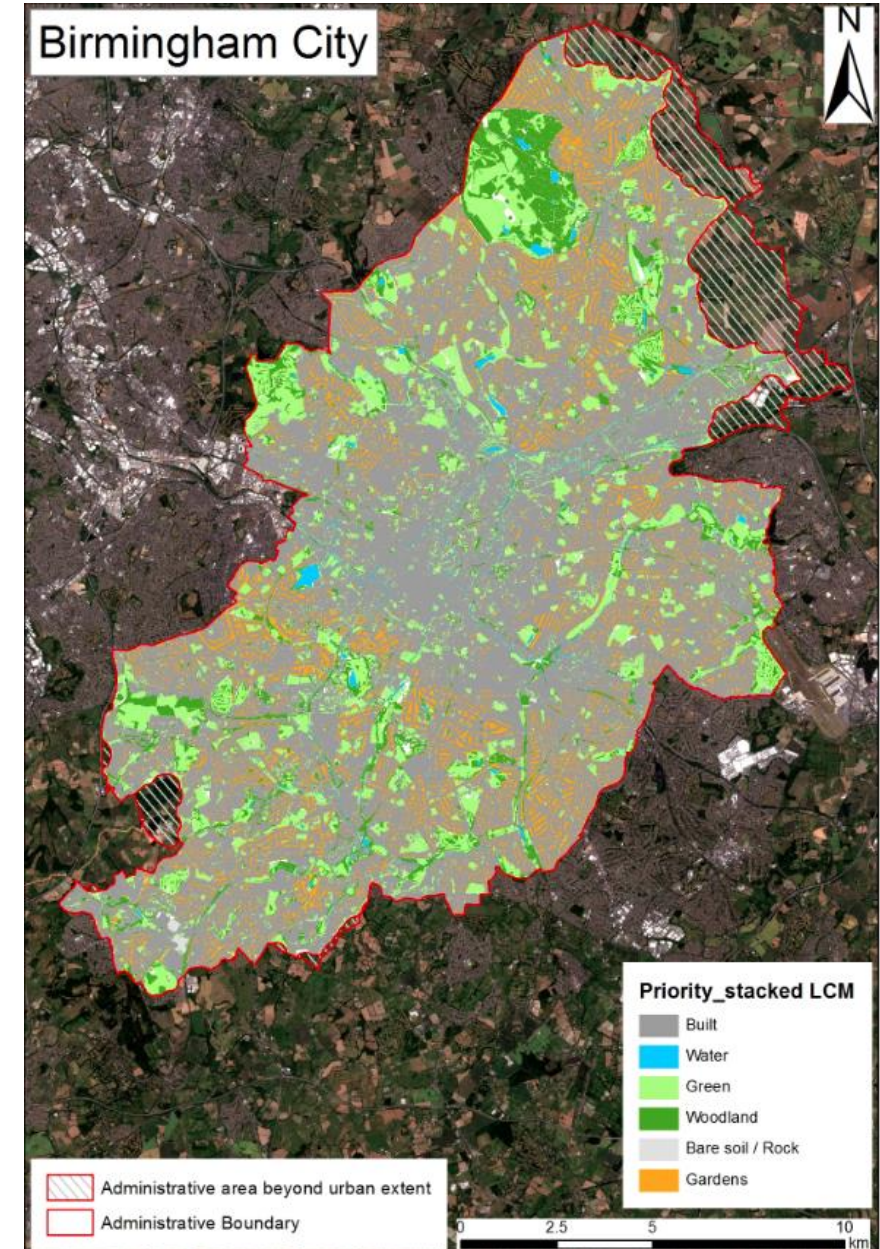

Urban extent (within administrative boundary)

urban footprint created for:

UK Urban Natural Capital Accounts (eftec et al. 2017; ONS 2020)

Urban natural capital:

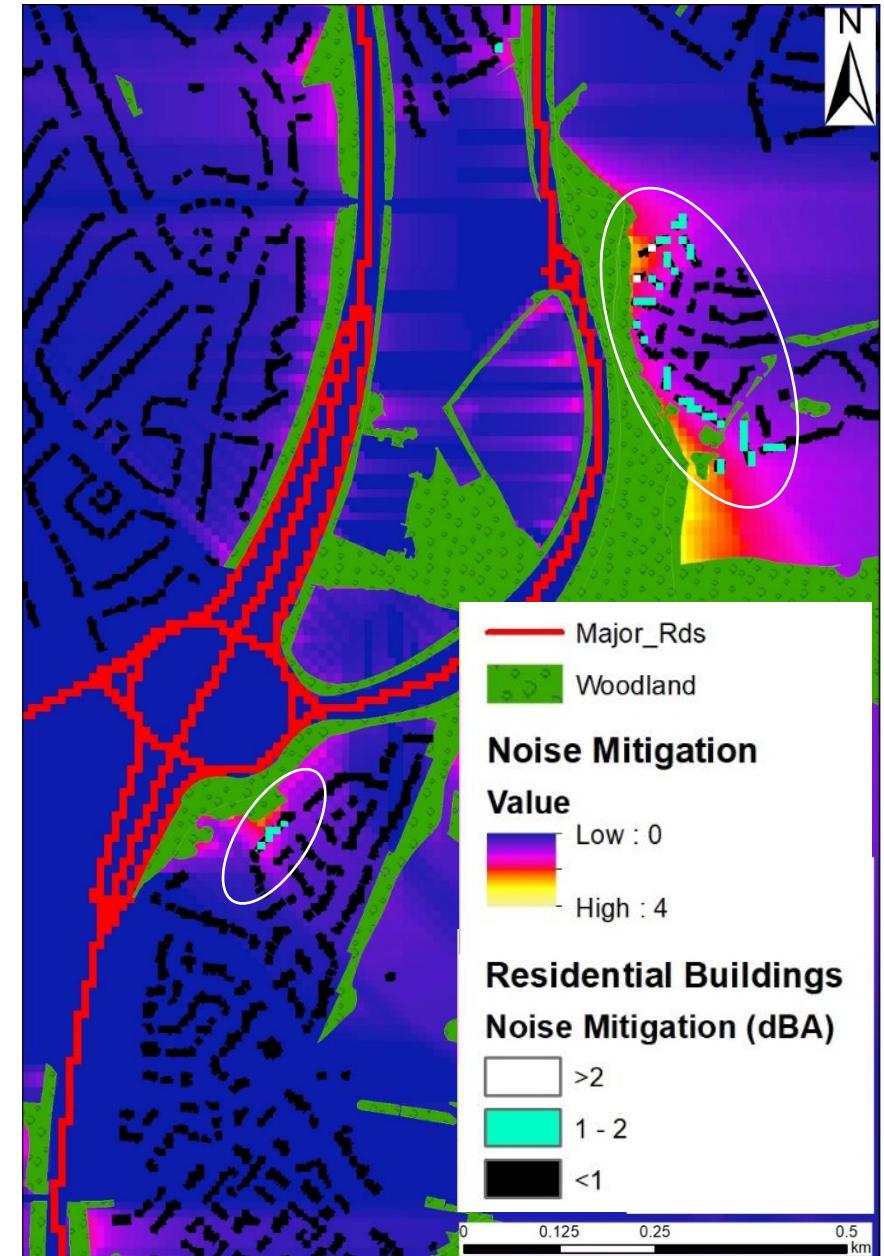

- Woodland
- Grassland
- Gardens
- Blue-space
- (OS Greenspace layer)

Modelling ecosystem service benefits

e.g. Local scale example of noise mitigation benefits provided by trees.

- Noise mitigation, 1-2 & 2+ dB(A)
- Mitigation estimated using UKCEH Noise Mitigation Model
- Original Noise levels from Defra (Extrium) don't account for presence of trees
- Outputs include number of residents benefitting from mitigation
- Calculating health benefit & economic benefit is also possible

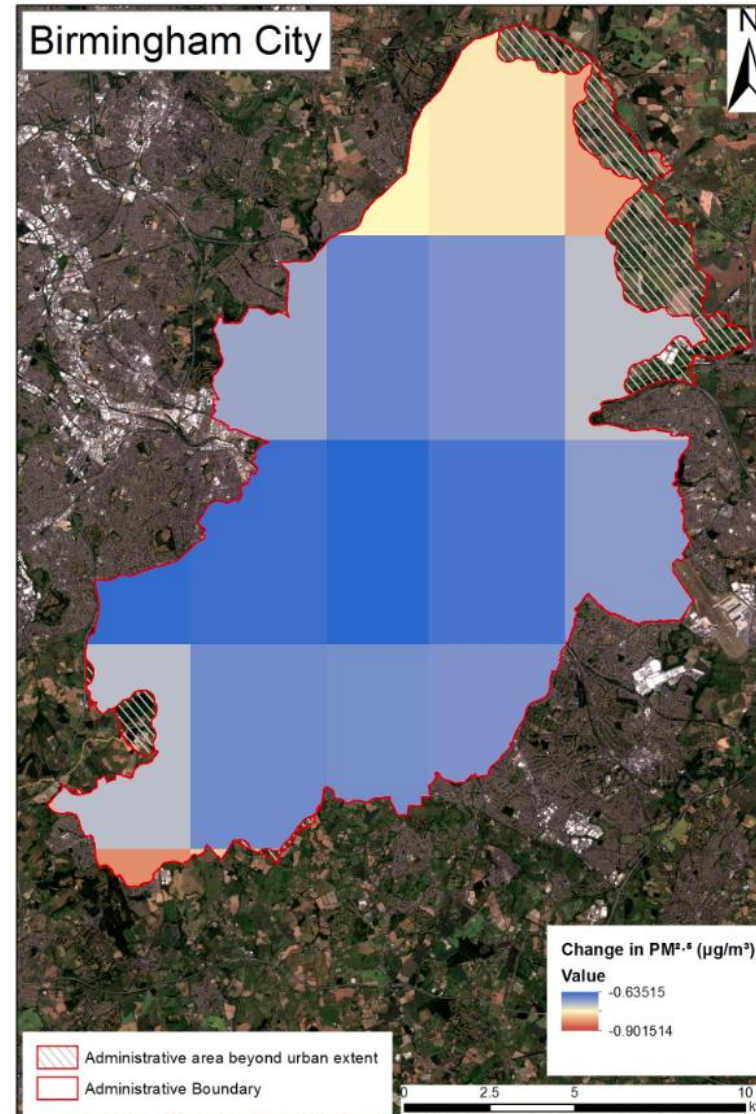

Modelling ecosystem service benefits

e.g. Pollution removal by vegetation

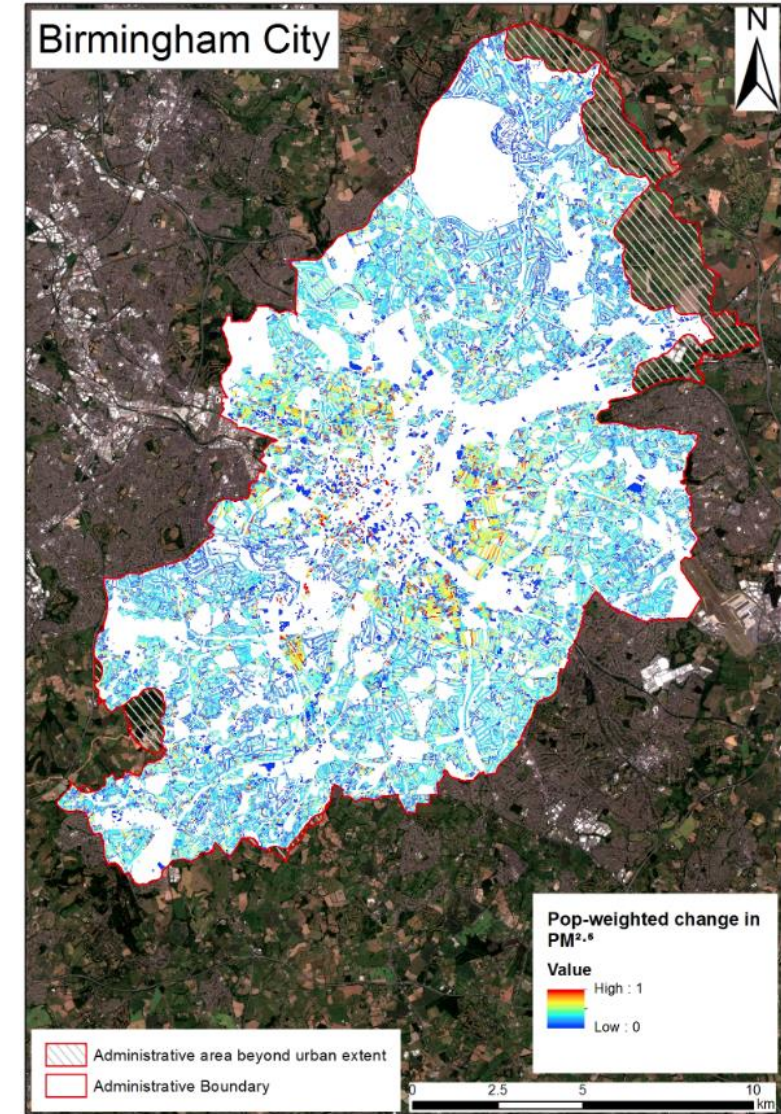

- Uses scenario modelling (Atmospheric Chemistry Transport Model – EMEP4UK)
- Health economics model ALPHA RiskPOLL

From ONS Natural Capital Account (Jones et al. 2017)

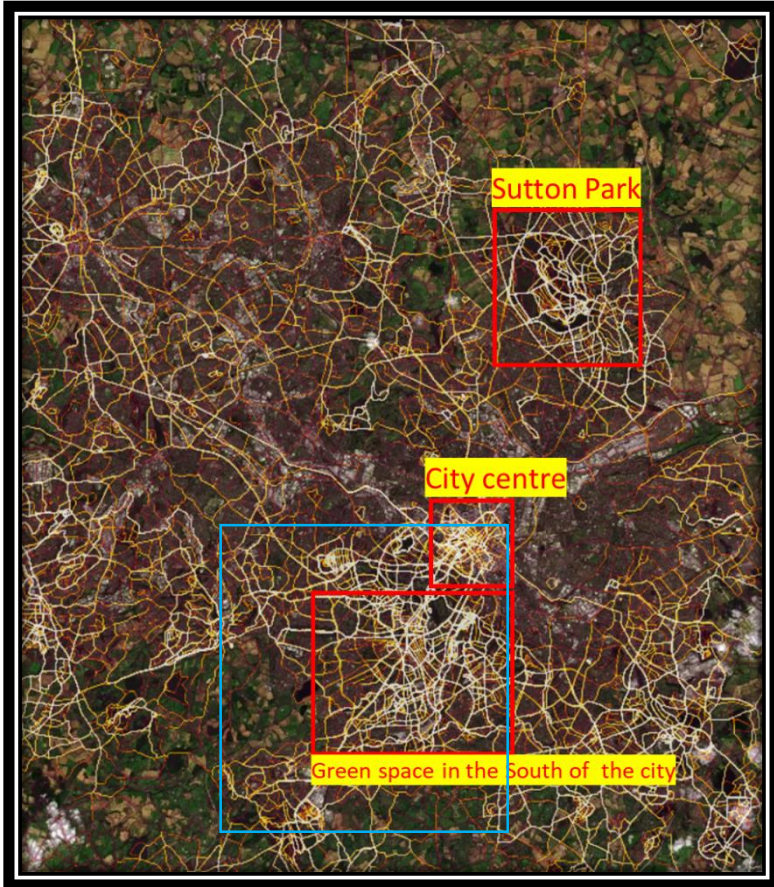

Change in pollution ($PM_{2.5}$) concentrations attributable to vegetation

Reduced exposure for benefitting population (weighted)

Urban Green Space usage in Birmingham

enlarged inset map

Running activity intensity based on Strava data

- Use discrete choice modelling to understand urban green space attraction through individual usage choices, especially modelling recreational round-trips for leisure;
- Based on social media data, e.g. Strava;
- Quantify the recreational value of parkland and its area of influence which helps define the scale (size and proximity) dependencies.

Financing NBS

Currently: High share of public funding

Challenges to attract more private funding:

- Uncertainty in **value creation**
- **Time-gap** between NBS implementation and expected revenues
- **Scale** dependency of benefits
- **Value capture** is difficult → Many benefits have the character of **public** (non-excludable, non-rival) and **common** (non-excludable, rival) **goods**

Average values for EU and US based on Almassy et al. (2018) and Zimmermann et al. (2019)

Encourage “testing” of new financing mechanisms

- Community asset transfers
- NBS - ‘Business Improvement Districts’
- Volunteer work
- Crowdfunding

A multi-domain framework
